

ERASYS

The Enterprise Standard for Agentic AI Governance

Governance-as-Code (GaC) — “Agentic AI’s border control.”

Enterprise client briefing: value proposition, strategic positioning, Minimum Viable Governance, go-to-market, and pilot guidance.

Document type	Strategic briefing for enterprise clients & partners
Positioning	Governance Overlay — not an ERP / platform replacement
Lead product	GoverUp (Minimum Viable Governance)
Audience	CISO, Infosec, Trust & Technology, AI Platform owners

1. Purpose of this document

Explain Erasys **Governance-as-Code (GaC)** to enterprise clients and establish **trust as the prerequisite for scaling agentic AI**. Erasys is the border control layer for agentic systems: who built the agent, who is operating it, whether it is trusted, whether outcomes are compliant and consistent, and how rogue activity is detected and tracked.

*Pivot: Erasys is not a platform replacement. It is a **Governance Overlay** that embeds compliance into agent workflows so Infosec and Trust & Technology teams can say “yes” to production AI without accumulating security debt.*

2. Context & problem

Enterprise AI adoption is accelerating; governance is lagging. Agents are treated as black boxes. Leadership cannot reliably answer: Are agents built for scale? Who is operating them? Are they trusted? Are results compliant and consistent? Is there rogue activity—and how proactively can it be detected and continually tracked?

Without an enforcement plane, every new agent increases audit, security, and regulatory risk. Traditional IAM, EDR, and ERP controls were not designed for autonomous tool-using agents that change goals mid-session. Erasys provides the connective tissue across enterprise AI and ERP estates—turning compliance from a blocker into a **scaling catalyst**.

3. The solution: Governance-as-Code

An end-to-end governance framework that delivers enterprise-grade confidence, auditability, and security for agentic workflows. GaC means policies, trust, identity, and human oversight are expressed as enforceable controls in the runtime path—not documentation after the fact.

Value statement. Erasys provides a Governance-as-Code layer bridging AI agility and enterprise control. Automating policy enforcement—from identity verification to risk interception—transforms compliance from a “No” gatekeeper into a continuous “Yes” accelerator. We secure agents and give developers the guardrails to scale production-grade AI without security debt.

3.1 Product ecosystem

Product	Role in the Governance Overlay
Builder	Token-efficient agent definition with scoped capabilities and templates — the controlled on-ramp.
GoverUp	Regulatory & policy screening firewall. Ingests enterprise and industry frameworks and enforces them in agent operations. Minimum Viable Governance lead.
Trust Registry	Registers agents and issues trust certificates; flags non-compliant workflows for security screening.
ClearFrame	Continual runtime audit of agent sessions for end-to-end enterprise governance.
SafePulse	Multi-layered behavioural biometrics for continuous human/agent identity verification and insider-threat signals without workflow friction.
Aegis	Goal monitoring and human-in-the-loop intervention for high-risk actions — visibility and control at scale.
Sonar	Infosec command centre for monitoring enterprise agentic operations and threat/drift events.

3.2 Why now & why Erasys

- **First-mover on agentic border control:** enterprises lack a dedicated enforcement plane for autonomous agents.
- **Defensible depth:** layered products (Swiss-cheese defence) close gaps that single-point IAM or logging tools miss.
- **Privacy by design:** architecture oriented to minimise PII exposure and support GDPR-aligned processing.
- **Integration posture:** designed as an overlay for cloud AI studios, ERP estates, and existing security stacks—not a rip-and-replace.

- **Aha! for CISOs:** GoverUp makes policy enforceable before tools run—immediate risk reduction without a full platform migration.

4. Strategic positioning — resolved answers

The following answers replace open clarification questions with a clear enterprise narrative.

4.1 Existing ERP / cloud AI integration

Position: Erasys is a **Governance Overlay**, not a competitor to Azure OpenAI, GCP Vertex AI, AWS Bedrock, Snowflake Cortex, or ERP suites. It plugs into agent runtimes and orchestration paths via APIs, webhooks, policy hooks, and marketplace-style embedding—enforcing trust, policy, HITL, and audit around whatever models and tools the enterprise already uses.

- **Azure / OpenAI Studio:** wrap agents and tools with GoverUp policy checks and Aegis approval gates before tool execution.
- **AWS Bedrock / AgentCore-style stacks:** sit as the third-party governance layer for tool allow-lists, audit export, and human approval.
- **GCP Vertex / ADK-style agents:** same overlay pattern—identity, policy, runtime audit, Infosec visibility.
- **Snowflake Cortex / ERP copilots:** govern high-risk actions (data export, write-backs, supplier changes) with policy + HITL, not by replacing the ERP.

*Integration model: **sidecar / gateway / SDK hooks** into the agent control plane. Erasys does not require migrating models, data platforms, or ERP systems.*

4.2 Synergy efficiencies — what Erasys complements vs replaces

Erasys does **not** claim to replace core identity or endpoint platforms. It fills the **agentic governance gap** those products were not built for.

Category	Relationship to Erasys
IAM / IdP (Ping, Okta, Entra)	Complement. Erasys consumes enterprise identity via SSO/OIDC; adds agent-level trust, session attestation, and continuous operator verification (SafePulse).
EDR / XDR (CrowdStrike, Cisco Secure, etc.)	Complement. Endpoint agents protect hosts; Erasys governs agent intent, tools, and policy with audit for Infosec (Sonar).
SIEM / SOAR	Complement. Export tamper-evident audit and threat events into existing SIEM; Erasys is the agentic source of truth.
Ad-hoc policy docs / manual reviews	Displace. GoverUp + ClearFrame automate enforcement and evidence that today lives in spreadsheets and after-the-fact reviews.
Homegrown agent gateways	Displace or absorb. Provide a productised, auditable control plane instead of one-off scripts.

4.3 Ideal pilot profile

Ideal pilot: a regulated or high-stakes business unit inside a mid-to-large enterprise (typically Finance, Legal, HR, Tax, Procurement, or Customer Operations) that is already experimenting with agents on legacy ERP / cloud AI stacks and is blocked by Infosec fear—not by model quality.

- **Prefer:** legacy ERP / regulated estates (200–20,000+ employees) with clear compliance owners.
- **Avoid as first logo:** pure startups with no Infosec gate—weak aha! and weak reference value.
- **Success metric:** governed agent sessions with policy denials + HITL approvals + exportable audit evidence—not vanity ROI charts.
- **Scope:** one workflow family (e.g. invoice exception agent, HR case triage, supplier risk screen)—not estate-wide day one.

4.4 User journey & deployment cycle

Phase	What happens	Typical timeline
0 — Access	Shared demo tenant: Builder, GoverUp, Trust Registry, ClearFrame, Aegis, Sonar walkthrough.	Day 0–3

1 — MVG pilot	Deploy GoverUp + ClearFrame + Aegis on one agent workflow; ingest 3–5 policies; enable HITL for high-risk tools.	2–6 weeks
2 — Hardening	SSO/OIDC, trusted HTTPS, SIEM export, Vault integrations, role model (admin/operator/auditor).	4–10 weeks
3 — Scale-out	Add SafePulse + Sonar; expand Trust Registry across agent inventory; portfolio playbooks by BU.	Quarter 2+
4 — Standard	Prescribe Erasys as Governance Overlay in cloud AI marketplaces / GSI reference architectures.	Ongoing

4.5 Portfolio scale-up (<200 vs >2,000)

- **<200 employees:** lead with SaaS/demo tenant + GoverUp MVG; light SSO; single Infosec owner. Fast proof, limited SIEM depth.
- **200–2,000:** MVG pilot in one BU; OIDC; audit export; 1–2 production workflows under Aegis.
- **>2,000 / global:** Governance Overlay programme with GSI; marketplace embedding (Bedrock/Vertex/Azure); Sonar as Infosec command centre; phased agent inventory via Trust Registry.

5. Go-to-market recommendation

Use **all three options in sequence**, not as mutually exclusive bets. Sequencing reduces sales cycle risk while building the partner channel.

5.1 Primary: Option 3 — Compliance-first pilot (ideal entry)

Lead with a high-stakes legacy ERP / regulated BU pilot. Sell the outcome: **compliance as a scaling catalyst**. Product wedge: **GoverUp + Aegis + ClearFrame** (Minimum Viable Governance). This creates the reference story Red Hat / GSIs / CISOs need.

5.2 Secondary: Option 1 — Trojan Horse (expand inside the account)

Where identity anxiety is the buying trigger, lead with **SafePulse / Aegis** for agentic authentication and high-risk intervention, then land GoverUp and Sonar. Do not open with the full suite in enterprise RFPs—it invites platform-replacement fear.

5.3 Parallel: Option 2 — Compliance-first partner / marketplace

Position Erasys as the **prescribed third-party Governance Overlay** in AWS / Azure / GCP AI marketplaces and GSI playbooks (Accenture, Deloitte, Red Hat consulting). This is the scale motion after 2–3 credible pilots—not the day-one motion.

5.2 Differentiation vs ERP / cloud AI platforms

They provide	Erasys provides
Models, data, orchestration, ERP workflows	Border control for agents acting on those systems
Identity of users (sometimes apps)	Trust of agents + continuous operator verification + HITL
Logging / observability of infra	Policy enforcement + tamper-evident agent audit evidence
“Build agents fast”	“Scale agents safely” — remove Infosec fear factor

6. Minimum Viable Governance (MVG)

Lead product: GoverUp — the CISO aha! moment. Immediate value: upload enterprise policies → auto-parse into enforceable rules → deny / require-approval / allow before tools run.

*MVG package for pilots: **GoverUp + ClearFrame (runtime audit) + Aegis (HITL)**. Builder is included for agent definition. Trust Registry, SafePulse, and Sonar expand in phase 2.*

- Week 1: ingest policies; register one agent; run governed session.
- Week 2–3: enable HITL on high-risk tools; export audit evidence.
- Week 4–6: attest frameworks (ISO 42001 / EU AI Act / GDPR evidence collection); executive readout.

7. Live pilot demo — access & framing

A shared demonstration tenant is available for partner and client evaluation. Frame it honestly as a **governed AI pilot lab**, not estate-wide production deployment.

Product name	Erasys ClearFrame — AI Governance and Safety
Demo URL (HTTP)	http://52.91.66.29
Demo DNS	http://ec2-52-91-66-29.compute-1.amazonaws.com
Login	admin@erasys.local — password issued in ClearFrame-Demo-Access.txt
TLS note	Use HTTP for this pilot host. HTTPS is self-signed and will trigger browser warnings.
Demo framing	Governance Overlay pilot — policy, HITL, audit, agent registry

What to show	Builder → GoverUp policy upload → Aegis approve/block → ClearFrame audit → Sonar / Metrics
What not to claim	ISO certification, estate-wide deployment, replacement of IdP/EDR/ERP, fake ROI

Rotate credentials after external partner sharing. Frame as a governed AI pilot lab, not production HA.

8. Honest scope (builds trust)

- Single-server / pilot-tenant demonstration is not multi-region HA production.
- SSO/OIDC is supported but must be configured per customer IdP.
- Trusted HTTPS requires a customer domain and CA-issued certificate.
- Platform collects technical evidence for ISO 42001 / EU AI Act / GDPR — it does not confer certification.
- LLM backends and ERP connectors are integration workstreams, not magic day-one coverage of every system.

9. Recommended stakeholder paragraph

“Erasys is the Governance-as-Code overlay for agentic AI—border control for who builds, who operates, what agents are trusted to do, and how every high-risk action is approved and audited. We do not replace your cloud AI platform or ERP. We make it safe to scale agents on top of them. Our Minimum Viable Governance entry is GoverUp: your policies become enforceable controls in the agent path, with human-in-the-loop and tamper-evident audit—so Infosec can approve production AI without security debt.”

Next step: book a 30-minute MVG demo (GoverUp → Aegis → ClearFrame) with the prospect’s CISO or AI platform owner, scoped to one Finance / Legal / HR workflow.
